## QUADRILATERALS

## All you need to know!

## 'Any' Quadrilateral

Sum of the $\angle^{\mathrm{s}}$ of any quadrilateral $=360^{\circ}$ $\left.\begin{array}{l}\text { Sum of the interior angles } \\ =(a+b+c)+(d+e+f) \\ =2 \times 180^{\circ} \quad \ldots\left(2 \Delta^{s}\right) \\ =360^{\circ}\end{array}\right)$

The arrows indicate various 'pathways' from 'any' quadrilateral to the square (the 'ultimate quadrilateral'). These pathways, which combine logic and fact, are essential to use when proving specific types of quadrilaterals.

See how the properties accumulate as we move from left to right, i.e. the first quad has no special properties and each successive quadrilateral has all preceding properties.

## STRAIGHT LINE GEOMETRY

- Important VOCABULARY

An acute angle is one that lies between $0^{\circ} \& 90^{\circ}$. An obtuse angle is one that lies between $90^{\circ} \& 180^{\circ}$. A reflex angle is one that lies between $180^{\circ} \& 360^{\circ}$.

A right angle $=90^{\circ}$
A straight angle $=180^{\circ}$
A revolution $=360^{\circ}$

When the sum of 2 angles $=90^{\circ}$, we say the angles are complementary.

When the sum of 2 angles $=180^{\circ}$, we say the angles are supplementary.

When 2 lines intersect, 4 angles are formed: $\hat{1}, \hat{2}, \hat{3}, \hat{4}$

## Adjacent angles

have a common vertex and a common arm,
e.g. $\hat{1}$ and $\hat{2}, \hat{2}$ and $\hat{3}, \hat{3}$ and $\hat{4}$ or $\hat{1}$ and $\hat{4}$

Vertically opposite angles
lie opposite each other, e.g. $\hat{1}$ and $\hat{3}$ or $\hat{2}$ and $\hat{4}$.

## - The FACTS

When 2 lines intersect:

- adjacent angles are supplementary
- vertically opposite angles are equal.

Copyright © The Answer Series: Photocopying of this material is illegal

These are pairs of co-exterior angles. These are never used.

## Angle notation

We usually use letters, not numbers for angles. On this page the numbering is intended to show the connections between angles.

## Important VOCABULARY

When 2 lines are cut by another line (a transversal), two families of angles are formed:

$$
\hat{1}, \hat{2}, \hat{3}, \hat{4} \text { and } \hat{5}, \hat{6}, \hat{7}, \hat{8}
$$

Both these groups are 'co-' angles
i.e. they are on the same side of the transversal

These are pairs of co-interior angles.
 supplementary.

Angles that 'alternate' are on opposite sides of the transversal.

These pairs of angles correspond.

Note: They are NOT necessarily equal.

## The FACTS

When 2 PARALLEL lines are cut by a transversal, then the corresponding angles are equal, the (interior) alternate angles are equal, and the co-interior angles are supplementary.

\& CONVERSELY:

If the corresponding angles are equal, or if the (interior) alternate angles are equal, or if the co-interior angles are supplementary, then the lines are parallel.

4.2 Mrs Foster is very fussy about which colour jellybeans she eats. Her favourite colour is orange, and her least favourite is yellow. There are $x+9$ orange jellybeans in a packet and $2 x-3$ yellow jellybeans in the same packet, in which there is a total of $2(x+8)$ yellow and orange jellybeans.
4.2.1 Set up an equation that represents the above paragraph.
4.2.2 How many of her favourite jellybeans did Mrs Foster get in the packet of sweets?
4.3 Mrs Louw loves her girls hockey team and after looking at their season she decided that they had an excellent season as the ratio of games won to games lost was $5: 1$. In terms of $x$, they only lost $x+4$ games.
4.3.1 Determine, in terms of $x$, how many games the girls won.
4.3.2 Using your answer in Question 4.3.1 determine how many matches the girls played if in terms of $x$ they played a total of 10x games.

## Note

These two terms will always be the same when multiplying out a squared bracket. Noticing these kinds of patterns will make you more efficient and more confident.

$$
\begin{aligned}
\text { 2.1.3 } & (2 x-1)(3 x+2) \\
= & 6 x^{2}+4 x-3 x-2
\end{aligned}
$$

$=6 x^{2}+x-2$
2.1.4 $\quad(2 x-5)(x-3)+(x+2)^{0}-(x-2)^{2}$
$=2 x^{2}-6 x-5 x+15+1-(x-2)(x-2)$
$=2 x^{2}-11 x+16-\left(x^{2}-2 x-2 x+4\right)$
$=2 x^{2}-11 x+16-\left(x^{2}-4 x+4\right)$
$=2 x^{2}-11 x+16-x^{2}+4 x-4$
$=x^{2}-7 x+12$

There is no rush: take the pressure off by doing one thing at a time and focus on accuracy
